

Grow / Finish

PRODUCT GUIDE

What is Grand Prairie®?

Grand Prairie® was developed for the producer who desires not to feed antibiotics or animal proteins to their livestock.

The swine industry continues to rapidly change and producers are faced with a growing amount of information relative to traditional pork production. In order to remain viable, today's natural pork producer must keep abreast of new developments and when appropriate, adapt and incorporate new products and technology into their production systems.

A pig producer's decision to change a feed product should be based on high-quality information most often derived from sound, scientific research. Ultimately, consumers have a major impact on the pork production chain, the consumers have voiced their opinions and want pork products raised free of antibiotics and animal proteins.

JBS United is actively defining the next frontier of technologies relating to animal nutrition and livestock production. Our expert swine research team constantly strives to use their knowledge and the latest technology, in the development of nutritional offerings to improve the efficiency of pork production in an environmentally responsible manner.

JBS United's team of swine nutritionists bring many years of academic and practical industry experience to the table. They work closely with swine producers to provide swine management and nutritional recommendations based on our research and with studies completed by universities and suppliers. The goal is to produce the best nutritional programs available and offer solutions for our customers' diverse needs.

The six, products of Grand Prairie® Grow/Finish were designed to deliver highly palatable nutrients to growing pigs. Grand Prairie® provides balanced nutrients and the ability to raise a consistent product for market.
